

SOCIAL NETWORKS AND MULTIAGENT SYSTEMS SYMPOSIUM *SNAMAS 2010*

AISB 2010 Convention

29th March - 1st April 2010, De Montfort University, Leicester

1 Symposium Chairs

Giulia Andrighetto (ISTC-CNR Rome)

Guido Boella (University of Turin)

Ugo Pagallo (University of Turin)

Serena Villata (University of Turin)

2 Abstract

One of the most interesting research topics in the field of multiagent systems is the definition of models with the aim of representing social structures such as organizations and coalitions, to control the emergent behavior of open systems. Organizations and coalitions are composed by individuals that are related to each other by different possible kinds of relations such as dependencies on goals, conflicts on resources, similar beliefs and so on. One important issue is how to represent these relations. Moreover, like the human organizations, these social structures are characterized also by an high degree of dynamism.

In dealing with societal issues, the multiagent systems field took inspiration mostly from organizational theory in economics and legal theory, while less attention is devoted to the research area describing the relations among the individuals inside human organizations and their dynamics: *social network analysis*. Social network analysis has emerged as a key technique in modern sociology, anthropology, social psychology, communication studies, information science, organizational studies, economics as well as a popular topic of study.

Despite the common object of study, multiagent systems and social network analysis use concepts like agents, dependencies, etc. which often have only superficial similarities. The aim of this symposium is to underline the differences and the similarity points

between these social network analysis and multiagent systems in the representation of the social structures and their dynamics, and to promote the interchange of knowledge and methodologies among the two fields.

3 Motivations

At AISB 2009 Convention, the Program Committee members Guido Boella, Harko Verhagen, Giulia Andrighetto e Jaime Sichman held the first SNAMAS Symposium. This Symposium fits the AISB'09 Convention theme "Adaptive and Emergent Behaviour and Complex Systems", since both social networks analysis and multiagent systems deal with the behavior of complex systems composed by many agents and have among theirs topic adaptivity and emergence, since it is not realistic to consider only top-down rigidly designed social systems. The invited speaker of the event was Prof. Kathleen M. Carley, an international expert in the field of social network analysis and dynamic network analysis. The event was followed by a special issue of the Computational and Mathematical Organization Theory on "Social Networks and Multiagent Systems" with Editor-in-Chief: Kathleen M. Carley and Guest Editors: Giulia Andrighetto, Guido Boella, Jaime Sichman, Harko Verhagen.

The SSAISB mission is to promote the study of artificial intelligence, simulation of behaviour and the design of intelligent system, and to facilitate co-operation and communication among those interested in these studies. This Symposium goes in the direction of interdisciplinarity in the study of social behavior, since both social networks analysis and multiagent systems develop techniques to capture the development of social systems, analyzing the behaviour of the individuals composing the systems and how and why does it change.

To give some more detail on social networks analysis, a social network is a social structure made of nodes (which are generally individuals or organizations) that are tied by one or more specific types of interdependency, such as values, visions, idea, financial exchange, friends, kinship, dislike, conflict, trade, web links, disease transmission (epidemiology). The resulting structures are often very complex. Social networks analysis plays a critical role in determining the way problems are solved, organizations are run, and the degree to which individuals succeed in achieving their goals. In its simplest form, a social network is a map of all of the relevant ties between the nodes being studied. These concepts are often displayed in a social network diagram, where nodes are the points and ties are the lines.

Social networks analysis has developed also the dynamics issue with the so called dynamic networks analysis. This is an emergent scientific field that brings together traditional social network analysis, link analysis and multi-agent systems. There are two aspects of this field. The first is the statistical analysis of dynamic networks analysis data. The second is the utilization of simulation to address issues of network dynamics. Dynamics networks vary from traditional social networks in that are larger dynamic and may contain varying levels of uncertainty. Whereas nodes in a traditional social networks analysis model are static, nodes in a dynamic networks analysis model have the ability to learn. Properties change over time, nodes can adapt: a company's employees can learn new skills and increase their value to the network. Illustrative problems of

the dynamic networks analysis area are developing metrics and statistics to assess and identify change within and across networks, developing and validating simulations to study network change, evolution, adaptation, developing and validating formal models of network generation and evolution, developing and testing theory of network change, evolution, adaptation.

Multiagent systems, in contrast, aim at modelling, among other things, cognitive agents who interact in dynamic environments where they depend on each other to achieve their goals. The emphasis is not on the study and simulation of human behavior, but rather on constructing complex systems composed by artificial and human agents which are regulated and behave like human social systems. Most attention was given to the top-down development of organizations, rather than to the emergence of coordination in social behavior based on the dependencies among agents and their dynamic.

Though the two fields consider similar issues, there is a huge gap, e.g., in techniques, either graph theory, or cognitive theory, or in perspectives: social networks adopt an external viewpoint, whereas agent theories adopt an internal or subjective viewpoint. Some interchange among the two fields already took place, like for example the use of dependence networks as a representation and reasoning framework in multiagent systems. This witnesses the fact that the two fields can benefit from an increase of exchange of knowledge. The communities are currently mostly separated (with the exception of events like AISB Symposia and the Multiagent-Based Simulation International Workshop Series (MABS)).

This workshop aims at promoting the interchange among the two communities to allow a transfer of methodologies, and to clarify the meaning of the respective terminologies which share many concepts but only at an informal level.

The Symposium aims not only at presentation of papers but also to promote the discussion about the following research questions:

- How to use social network analysis results for developing multiagent systems?
- Which insights can be gained from multiagent research as input for social network theory?

As concerns the first question, social networks can be used during the design of multiagent systems, or an explicit representation of social networks can be used by agents to reason about virtual communities on the web. As concerns the second question, one may argue that social networks can be made more detailed with a multiagent model, for example, extending the social network with a communication model, or recursive reasoning in a social network, to consider how agents can have a model of other agents.

Papers on the following non-exhaustive list of topics are solicited:

- Emergent behaviour in multiagent systems and social networks analysis
- Simulation of social systems
- Learning evolution and adaptation in multiagent systems and social networks analysis
- Artificial social systems
- Societal aspects
- Models of personality, emotions and social behaviour
- Organizations in Multiagent systems and Social Networks

4 Invited speaker

TBA

5 Important Dates

Paper submission deadline: December 19, 2009.

Notification of acceptance: January 30, 2010.

Camera ready version: TBA

Symposium: 29th March - 1st April 2010.

6 Special Issue SNAMAS 2010

A selection of the accepted papers will be published in a special issue of the Journal of Computational and Mathematical Organization Theory, Editor-in-Chief: Kathleen M. Carley, Springer.

7 Paper submission

The guidelines for paper submission are as the following:

- The paper should be written in English.
- The maximum length of a paper is 6 A4-sized pages in ECAI format (format download: <http://www.aisb.org.uk/convention/aisb08/download.html>).
- The paper should be in PDF format.
- Please submit via the online paper submission system.
- A selection of papers will be published in a special issue of a relevant journal.

8 Programme Committee

Patrice Caire, University of Luxembourg, Luxembourg

Cristiano Castelfranchi, ISTC-CNR Rome, Italy

Rosaria Conte, ISTC-CNR Rome, Italy

Terrill Frantz, Carnegie Mellon University, USA

Francesca Giardini, ISTC-CNR Rome, Italy

Gustavo A. Giménez Lugo, Federal Technological University of Paraná, Brasil

Brian Hirshman, ISR: Computation, Organizations and Society, USA

Daniel T. Maxwell, Innovative Decisions Inc.

Jeremy Pitt, Imperial College London, UK

Jaime Sichman, University of Sao Paulo, Brasil

Carles Sierra, IIIA-CSIC, Spain

Pietro Terna, University of Turin, Italy

Leendert van der Torre, University of Luxembourg, Luxembourg

Harko Verhagen, Stockholm University, Sweden
